INTRODUCTION
Sugarcane is largely cultivated in dystrophic Latosols and Argisols, with poor levels of nutrients. Despite corrections and fertilizations carried out during planting operations with the nutrient, sulfur deficiency (S) in the ratoons is very common.

Under these conditions the most commonly applied source is the phosphogypsum at a minimum rate of 1 t ha\(^{-1}\) due to the operational difficulty of application in smaller quantities, besides that, an extra agricultural operation is needed, since it is impossible to mix with the fertilizers.

OBJECTIVES
Evaluate the effect of Polyhalite as S source, comparing to phosphogypsum, in sugarcane ratoon.

MATERIAL AND METHODS
Location: Catanduva, SP, Brazil. Sugarcane variety RB 86-7515 shortly after second harvest, therefore a ratoon for third.

Soil: 134 g kg\(^{-1}\) clay, 769 g kg\(^{-1}\) sand, 97 g kg\(^{-1}\) silt, soil fertility in 0-20 and 20-40 cm layers presented in Table 1 below.

GM (sodium dichromate 4N and H\(_2\)SO\(_4\); TiO\(_2\)); P, K, Ca, Mg (Resin); Al (KCl); H\(_{\text{Al}}\) (SMP); S (calcium phosphate).

Statistical design: randomized blocks, with 7 treatments in 4 blocks.

Treatments: 120 kg ha\(^{-1}\) of nitrogen (N), and 120 kg ha\(^{-1}\) of potassium (K\(_2\)O). N sources: ammonium nitrate, 33% N (AN) and urea, 45% N (UR), S sources: phosphogypsum, 15% S (PG), ammonium sulfate, 21% N and 24% S (AS) and Polyhalite, 19% S (PH). Sources of K\(_2\)O: MOP, 60% K\(_2\)O, and PH, 14% K\(_2\)O. PH also contains 12% Ca and 3.6% Mg.

The rate of PG was 1 t ha\(^{-1}\) (sugarmel standard management), and with the other sources the rate was 30 kg ha\(^{-1}\) of S.

The treatments were:
- T1: without N, without KCl, with PG;
- T2: AN + MOP;
- T3: AN + MOP + PG;
- T4: UR + MOP;
- T5: UR + MOP + PG;
- T6: blend of UR + AS + MOP;
- T7: AN, MOP + PH blend.

RESULTS AND DISCUSSION

Evaluations: stem yield, sugar content in stems (Total Reversible Sugars - TRS) and estimated sugar yield.

Responses observed according to N sources, UR with inferior results in yield. The application of PG did not significantly increase the effect of the nitrogen sources AN and UR.

The blend with SA significantly increased the effect of UR. S supply through the blend of PH and MOP was the one that presented better results in relation to yield of stems and sugar.

CONCLUSIONS
Polyhalite is a viable fertilizer as source of sulfur for sugarcane ratoons, suitable for phosphogypsum replacement, even when applied with higher rates.

ACKNOWLEDGMENTS
